### 3 Week 5

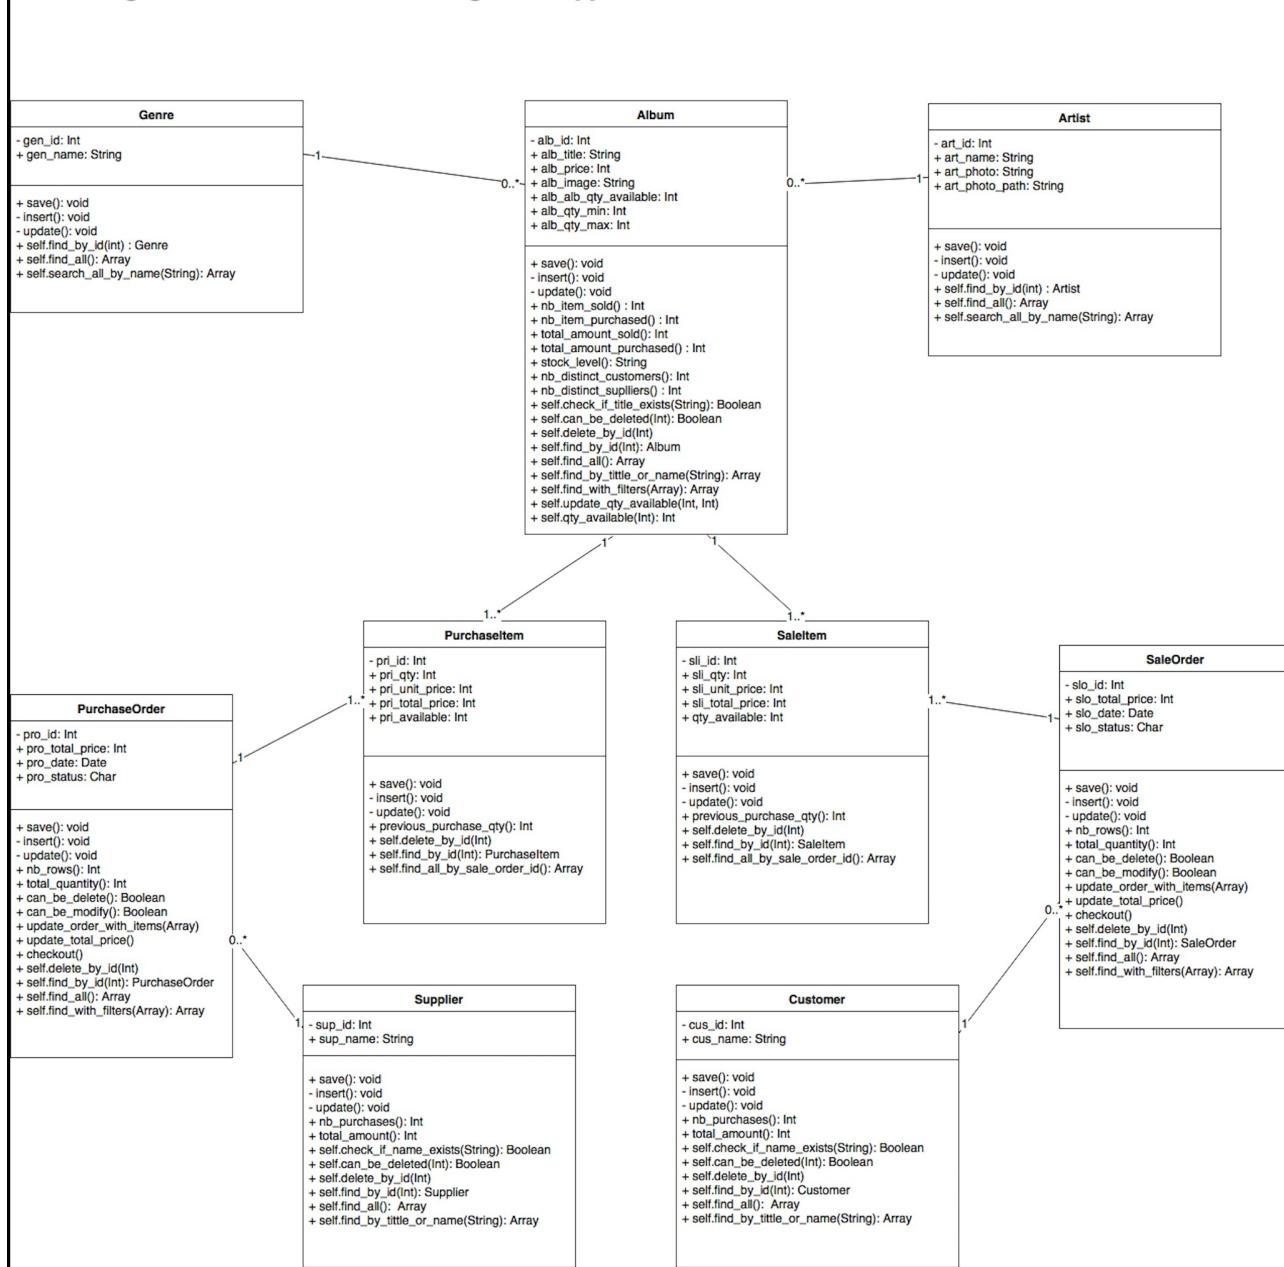

#### 3.1 A.D 1

#### Use Cases for the manager of a music store

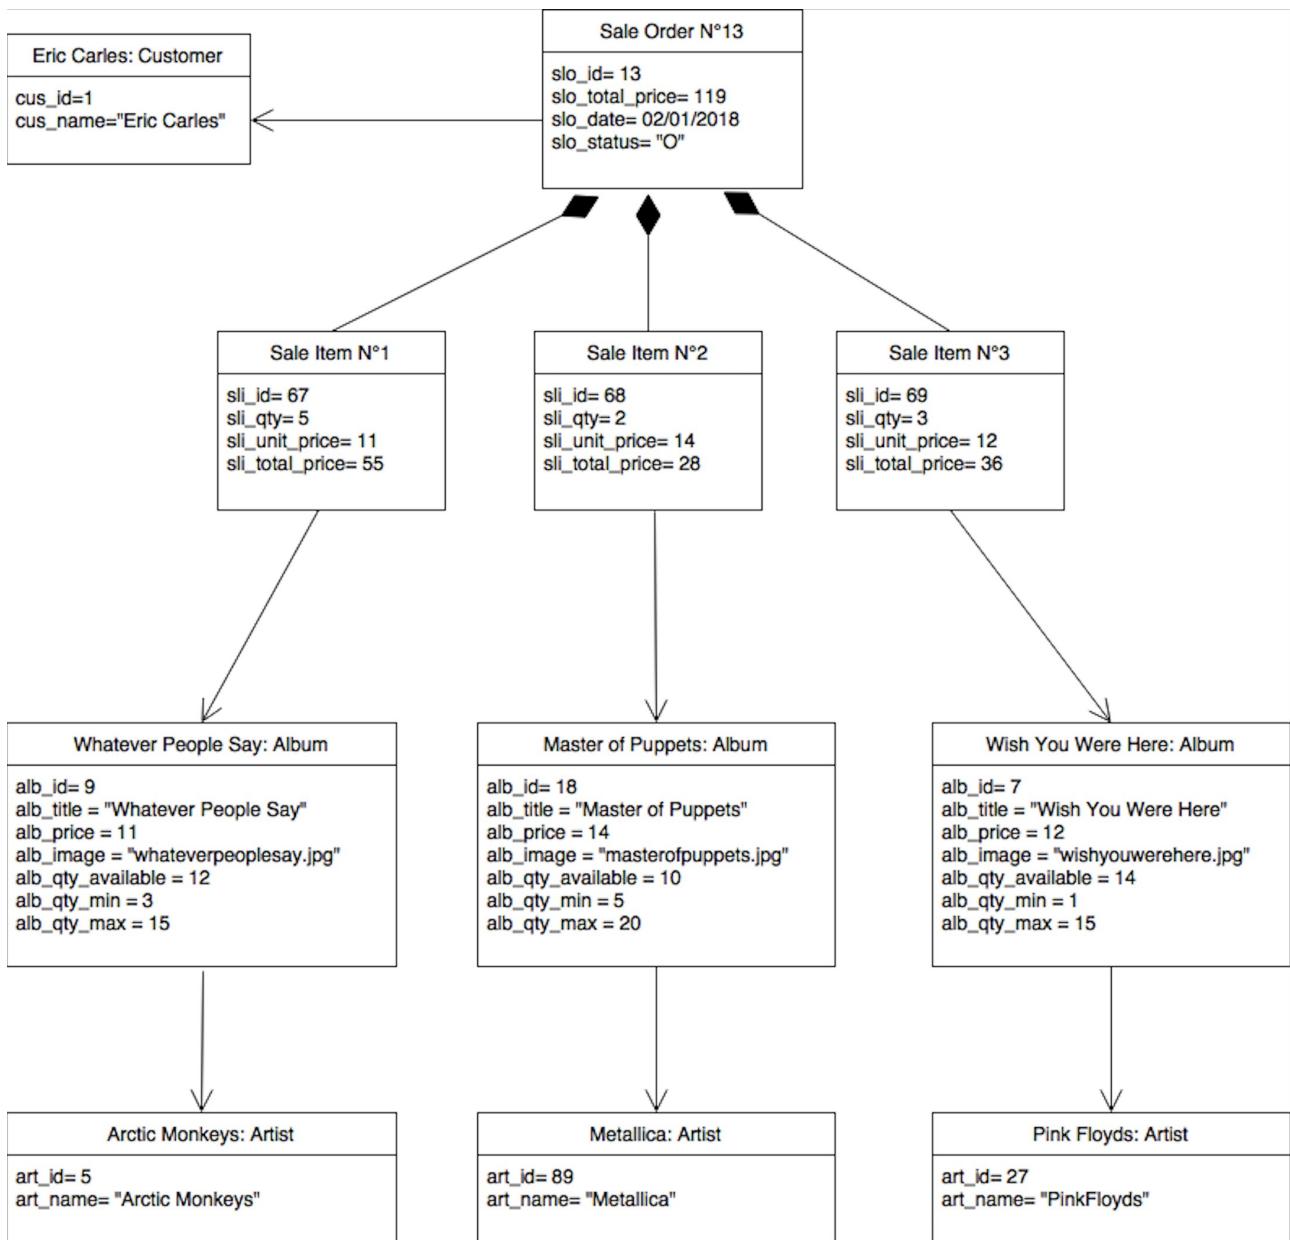

## 3.2 A.D 2

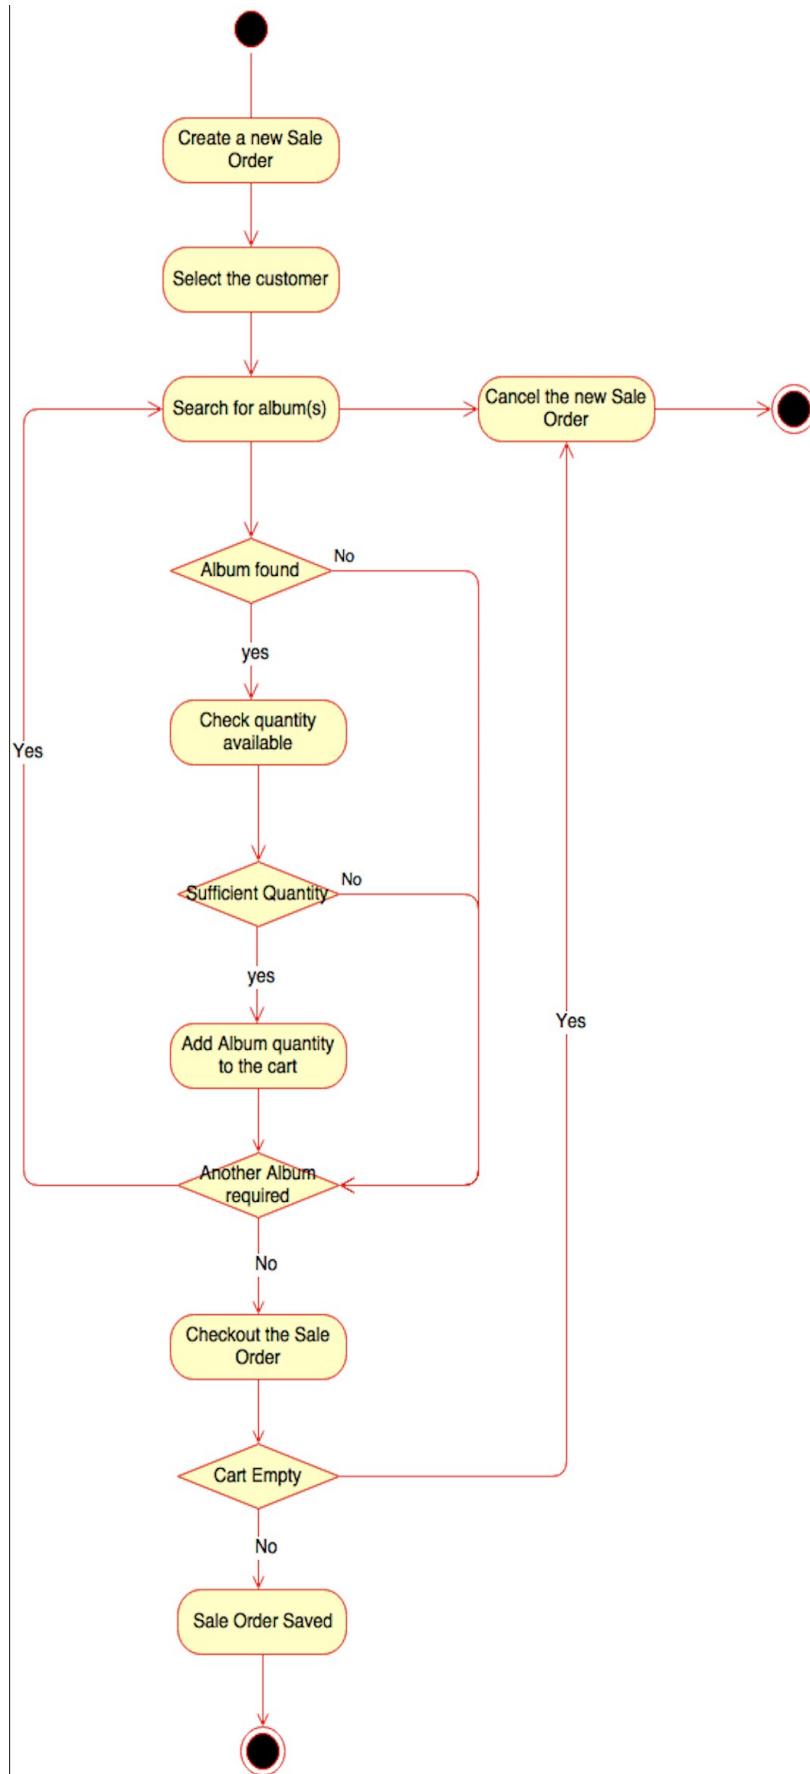

**Class Diagram of the music store management application**

### 3.3 A.D 3

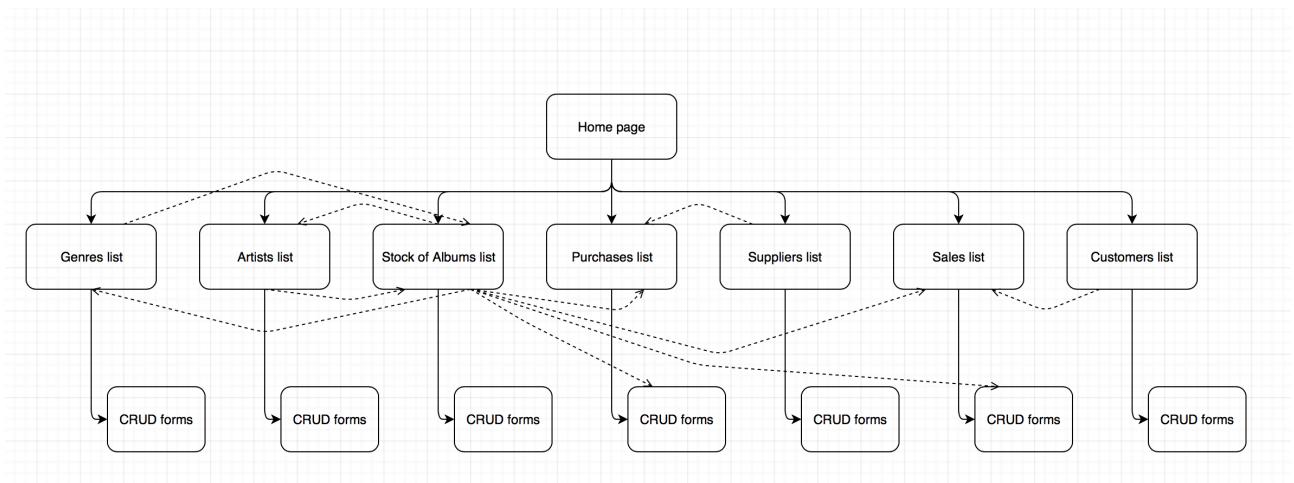

### 3.4 A.D 4

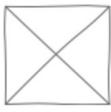

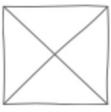

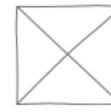

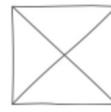

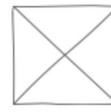

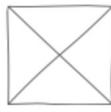

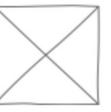

### 3.5 A.D 6

<b>Topic</b>	<b>Possible effect of constraints on product</b>	<b>Solution</b>
Hardware and software platforms	The software platform is made of Ruby without any Javascript. This induces that when the user performs an action then the whole page is reloaded.	Track the status of each page to be sure that after reloading the status page is still consistent.
Performance requirements	The Ruby language is not well-known for its performance and can induce a time lagging.	Limit the number of results on each page.
Persistent storage and transactions	The data like the artists, the albums, the album sales and purchases must be persisted.	Use the "postgresql" database as a support for persistence.
Usability	The application might be used with different screen resolutions.	Implement responsive user interfaces.
Budget	The cost of licenses must be £0.	Use only free frameworks and tools like the Ruby Sinatra framework and Atom as an IDE.
Time limitation	1 week project.	Ordered the functional project priorities relying on the "MosCow" approach.

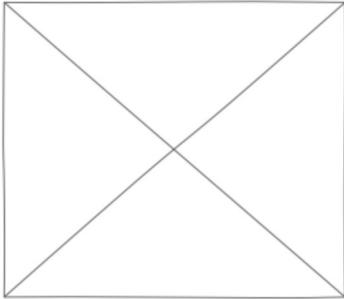

### 3.6 P 5

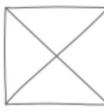

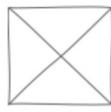

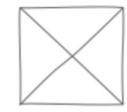

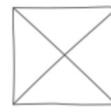

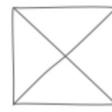

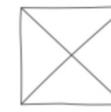

### 3.7 P 6

						
Genres	Artists	Stock of Albums	Purchases	Suppliers	Sales	Customers

Add a new album in the stock

	Artist	U2
	Genre	POP/ROCK

### 3.8 P 10

```
# Pseudocode to find all the albums which match with the provided filters
# find_albums_with_filters(filters, limit)
# - Initialize the sql query for albums
# - For each filter in filters
#       if the filter value is not null
#           then add the filter to the WHERE clause of the query
#       end if
#   end for
# - Add the clause ORDER BY title to the sql query
# - if limit > 0
#     then add the statement LIMIT to the sql query
# end if
# - Return the result of the sql query execution
```

## 3.9 P 13

The manager creates a new stock entry for the album “Wish You Were Here” :

[Genres](#) [Artists](#) [Albums](#) [Customers](#) [Suppliers](#) [Sale Orders](#) [Purchase Orders](#)

Add a new Album in the Stock

Artist	<input type="text" value="Pink Floyd"/>
Genre	<input type="text" value="Rock"/>
Title	<input type="text" value="Wish You Were Here"/>
Quantity in stock	<input type="text" value="10"/>
Min. Stock	<input type="text" value="3"/>
Max. Stock	<input type="text" value="20"/>
Sale Price per unit (£)	<input type="text" value="14"/>

[Save](#)

As a result, the new album is now present in the stock :

<a href="#">Genres</a>	<a href="#">Artists</a>	<a href="#">Albums</a>	<a href="#">Customers</a>	<a href="#">Suppliers</a>	<a href="#">Sale Orders</a>	<a href="#">Purchase Orders</a>
		<a href="#">Albums</a>				
			<input type="text" value="Wish You Were Here"/>	<input type="text" value="Artist"/>	<input type="text" value="Genres"/>	<input type="text" value="Stock Level"/>

Create a new Album

Cover	Title & Artist	Genre	Stock	Purchases	Price/Unit	Sales	Modify	Delete
	Wish You Were Here Pink Floyd	Rock	Avail. Min. Max.  10 3 20	Qty Pur. Total Nb. Sup.  0 £0 0	£14	Qty Sold Total Nb. Cus.  0 £0 0	<a href="#">Modify</a>	<a href="#">Delete</a>

## 3.11 P 15

The manager of the music albums store wants to select the albums whose kind is “Pop” and which are running low :

<a href="#">Genres</a>	<a href="#">Artists</a>	<a href="#">Albums</a>	<a href="#">Customers</a>	<a href="#">Suppliers</a>	<a href="#">Sale Orders</a>	<a href="#">Purchase Orders</a>
<a href="#">Albums</a> <input type="text" value="Title"/> <input type="text" value="Artist"/> <input type="button" value="Pop"/> <input type="button" value="Low"/> <input type="button" value="List"/> <input type="button" value="GO !"/> <a href="#">Create a new Album</a>						
Cover	Title & Artist	Genre	Stock	Purchases	Price/Unit	Sales
	A Hard Day's Night The Beatles	Pop	Avail. Min. Max.  9 5 15	Qty Pur. Total Nb. Sup.  18 £66 4	£16	Qty. Sold Total Nb. Cus.  14 £224 3
	A Quick One The Who	Pop	Avail. Min. Max.  5 0 15	Qty Pur. Total Nb. Sup.  7 £40 3	£24	Qty. Sold Total Nb. Cus.  13 £312 3
	Abraxas Santana	Rock	Avail. Min. Max.  6 5 18	Qty Pur. Total Nb. Sup.  3 £8 2	£11	Qty. Sold Total Nb. Cus.  2 £22 1
	Achtung Baby U2	Death Metal	Avail. Min. Max.  10 3 17	Qty Pur. Total Nb. Sup.  5 £35 3	£37	Qty. Sold Total Nb. Cus.  14 £518 3
	Aladdin Sane David Bowie	Rock	Avail. Min. Max.  7 5 17	Qty Pur. Total Nb. Sup.  7 £42 1	£19	Qty. Sold Total Nb. Cus.  4 £76 1

As a result, the list of the matching albums is displayed :

<a href="#">Genres</a>	<a href="#">Artists</a>	<a href="#">Albums</a>	<a href="#">Customers</a>	<a href="#">Suppliers</a>	<a href="#">Sale Orders</a>	<a href="#">Purchase Orders</a>
<a href="#">Albums</a> <input type="text" value="Title"/> <input type="text" value="Artist"/> <input type="button" value="Pop"/> <input type="button" value="Low"/> <input type="button" value="List"/> <input type="button" value="GO !"/> <a href="#">Create a new Album</a>						
Cover	Title & Artist	Genre	Stock	Purchases	Price/Unit	Sales
	Brothers in Arms Dire Straits	Pop	Avail. Min. Max.  0 1 15	Qty Pur. Total Nb. Sup.  0 £0 0	£50	Qty. Sold Total Nb. Cus.  0 £0 0
	LA Woman The Doors	Pop	Avail. Min. Max.  1 3 17	Qty Pur. Total Nb. Sup.  0 £0 0	£27	Qty. Sold Total Nb. Cus.  0 £0 0
	The Who Sings My Generation The Who	Pop	Avail. Min. Max.  2 2 18	Qty Pur. Total Nb. Sup.  3 £6 1	£27	Qty. Sold Total Nb. Cus.  1 £27 1

## 3.12 I.T Task A

Please check [https://github.com/BlueMorning/Eric\\_Carles\\_E18\\_PDA](https://github.com/BlueMorning/Eric_Carles_E18_PDA) for the Task A.

The 3 tests which fail :

```
Run options: --seed 64068
# Running:
E
Finished in 0.001016s, 984.2517 runs/s, 0.0000 assertions/s.

The 3 tests which pass :

```
Run options: --seed 37129
# Running:
...
Finished in 0.000939s, 3194.8900 runs/s, 3194.8900 assertions/s.

3 runs, 3 assertions, 0 failures, 0 errors, 0 skips
```

## 4 Week 6

### 4.1 I.T 7

In this example I'm using an abstract class "Fighter" and 2 sub-classes : "Warrior" and "Magician".

The abstract class "Fighter" has an abstract method "takeDamages".

```
1  public abstract class Fighter {
2
3      protected String name;
4      protected int health;
5
6
7
8      public Fighter(String name, int health){
9          this.name = name;
10         this.health = health;
11     }
12
13     public abstract void takeDamages(int damages);
14
15 }
```

Both sub-classes has a different implementation of this method :

The damages taken by the "Warrior" are reduced by its armor.

```
1  public class Warrior extends Fighter {  
2  
3      private int armor;  
4  
5      public Warrior(String name, int health, int armor){  
6          super(name, health);  
7          this.armor = armor;  
8      }  
9  
10     @Override  
11     public void takeDamages(int damages) {  
12         this.health -= Math.max(0, damages - armor);  
13     }  
14 }  
15 }
```

While the Wizard does not have any protection to reduce the damages :

```
1  public class Wizard extends Fighter {  
2  
3  
4  
5      public Wizard(String name, int health) {  
6          super(name, health);  
7      }  
8  
9      @Override  
10     public void takeDamages(int damages) {  
11         this.health -= damages;  
12     }  
13 }  
14 }
```

In the runner file a "Warrior" and a "Wizard" objects are created and both are added in an array of "Fighter" objects. Both have an initial health of 10 points.

Then the "takeDamages" is called on both with a damage value of 5 points.

```
5 ► public class Runner {  
6  
7 ►   public static void main(String[] args){  
8  
9     Warrior warrior = new Warrior( name: "Conan", health: 10, armor: 3);  
10    Wizard wizard = new Wizard( name: "Harry Potter", health: 10);  
11  
12    ArrayList<Fighter> fighters = new ArrayList<>();  
13    fighters.add(warrior);  
14    fighters.add(wizard);  
15  
16  
17    for(Fighter fighter : fighters){  
18      fighter.takeDamages(5);  
19    }  
20  
21    for(Fighter fighter : fighters){  
22      System.out.println(String.format("%s health is : %s", fighter.name, fighter.health));  
23    }  
24  }
```

The result shows that the damages of the “Warrior” have been reduced by 3 points thanks to his armor while the “Wizard” has lost 5 points.

```
Conan's health is : 8  
Harry Potter's health is : 5
```

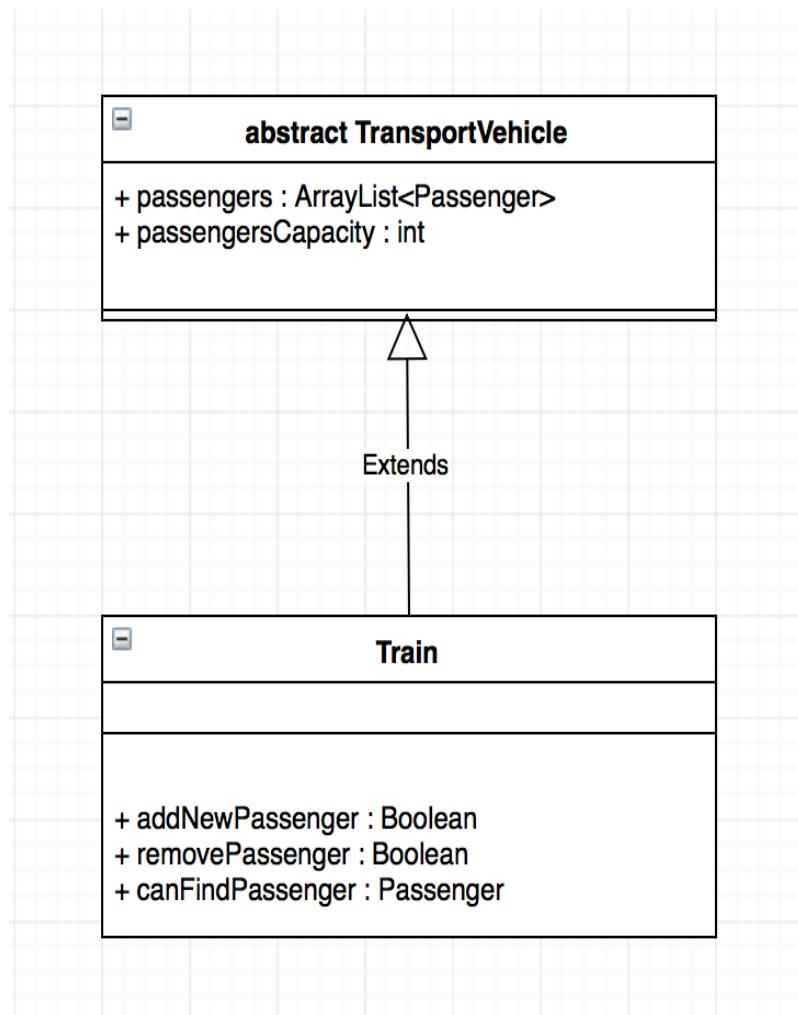

```
Process finished with exit code 0
```

To conclude, “Warrior” and “Wizard” objects can have different forms, they can be considered as “Fighter” objects. However, even under a “Fighter” form they behave specifically depending on their class “Warrior” and “Wizard”, this feature is an illustration of polymorphism.

## 5 Week N°9

### 5.1 A.D 5

In this example, the class "Train" inherits from the abstract class "TransportVehicle"

## 5.2 I.T1

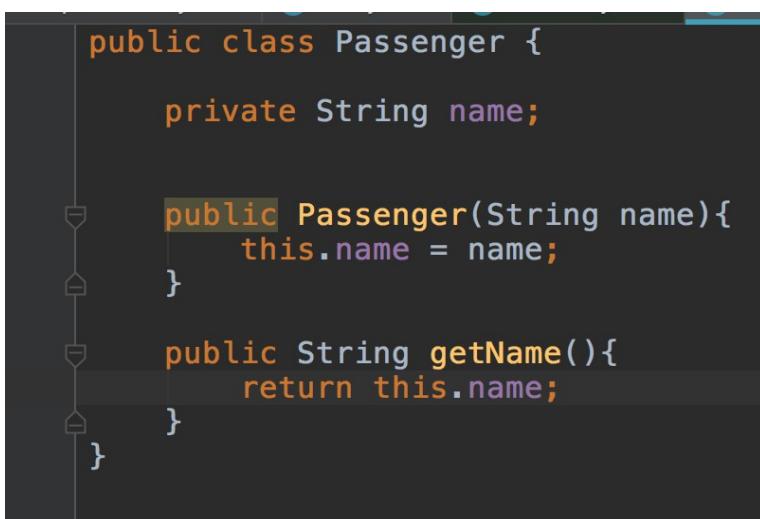

The “TransportVehicle” class is an abstract class whose properties passengerCapacity and passengers are declared “protected”. Thus, only classes which extend TransportVehicle can see them.

```
import java.util.ArrayList;

public abstract class TransportVehicle {

    protected int passengerCapacity;
    protected ArrayList<Passenger> passengers;
}
```

In this second example, the property “name” is declared as private thus it's visibility is limited to the class itself. The public method “getName” provides a way to other classes to get the name of the passenger.

A screenshot of a Java code editor showing the definition of the Passenger class. The code is as follows:

```
public class Passenger {

    private String name;

    public Passenger(String name){
        this.name = name;
    }

    public String getName(){
        return this.name;
    }
}
```

## 5.3 I.T2

The “TransportVehicle” class is an abstract class.

```
import java.util.ArrayList;

public abstract class TransportVehicle {

    protected int passengerCapacity;
    protected ArrayList<Passenger> passengers;
}
```

The "Train" class inherits from TransportVehicle with the keyword "extends"

```
import java.util.ArrayList;

public class Train extends TransportVehicle {

    public Train(int passengerCapacity) {
        super(passengerCapacity);
        this.passengers = new ArrayList<>();
    }

    public Passenger findPassenger(String passengerName){
        for(Passenger passenger : this.passengers){
            if(passenger.getName().equals(passengerName)){
                return passenger;
            }
        }
        return null;
    }

    public boolean addNewPassenger(Passenger newPassenger){
        if(this.passengers.size() < this.passengerCapacity){
            this.passengers.add(newPassenger);
            return true;
        }
        else{
            return false;
        }
    }

    public boolean removePassenger(Passenger passenger){
        if(this.passengers.contains(passenger)){
            this.passengers.remove(passenger);
            return true;
        }
        else{
            return false;
        }
    }
}
```

The "Train" class uses the property "passengerCapacity" and "passengers" inherited from the "TransportVehicle" class to manage the passengers who get on or off the train.

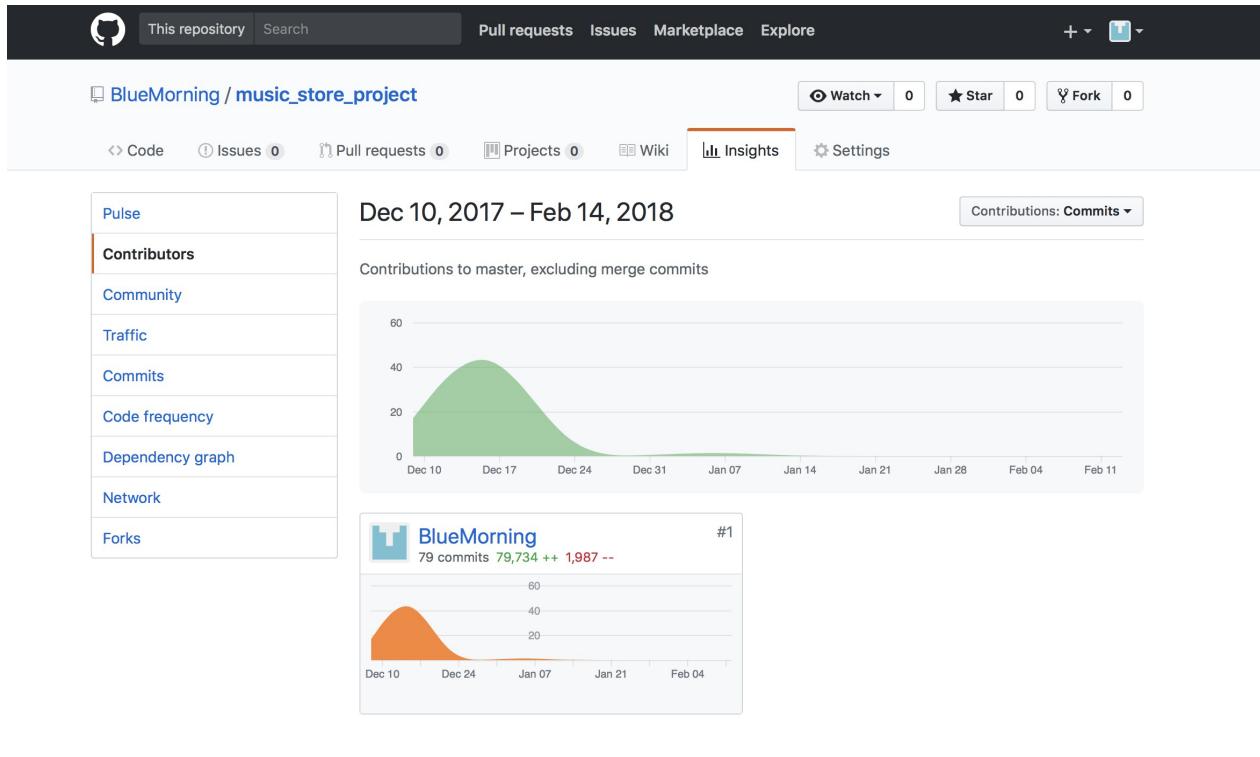

The list of passengers is encapsulated in the class "Train" : it is not visible from outside the class. However, the "Train" class provides methods to manage the list of passengers :

- findPassenger : find a passenger by his name
- addNewPassenger : add a new passenger onboard
- removePassenger : remove a passenger from the list when he gets off the train.

Thus, for other classes, the management of the list of passengers is a blackbox.

## 5.4 P 11

[https://github.com/BlueMorning/music\\_store\\_project](https://github.com/BlueMorning/music_store_project)

## 5.5 P12

About the planning of the Music Store project, the features and their priorities are referenced in the table above :

Music Store project

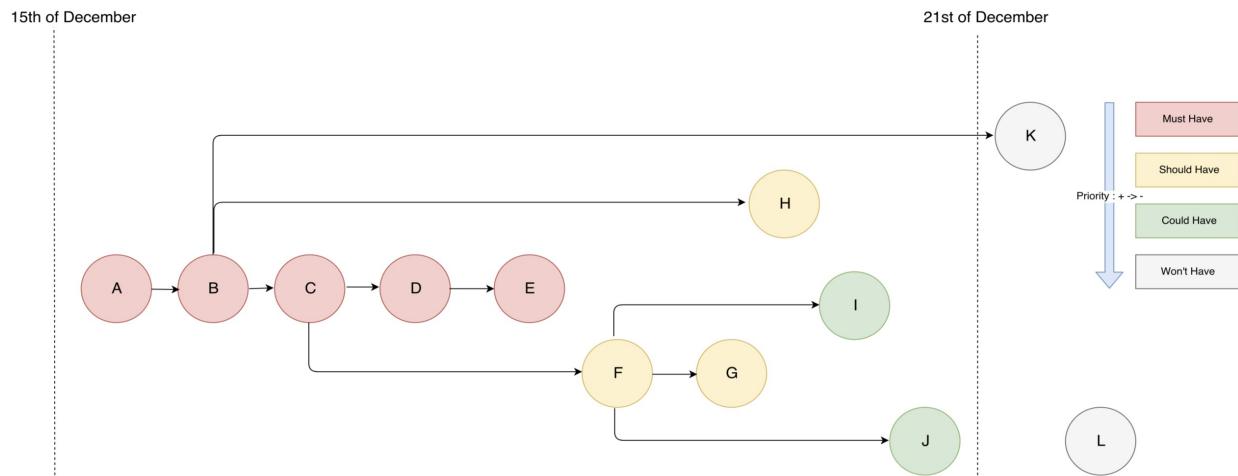

Features

Task Id.	Features	Priority	Dependency
A	CRUD Artists	1	-
B	CRUD Albums	1	A
C	CRUD Stocks	1	B
D	Display the inventory	1	C
E	Show a stock level for each album	1	D
F	Add a buy and sell price to each stock item	2	C
G	Calculate the possible markup on items and show on inventory page	2	F
H	Add a genre to an album	2	B
I	CRUD Suppliers	3	F
J	CRUD Customers	3	F
K	CRUD Tracks	4	B
L	CRUD Stores	4	-

Must Have	1
Should Have	2
Could Have	3
Won't Have	4

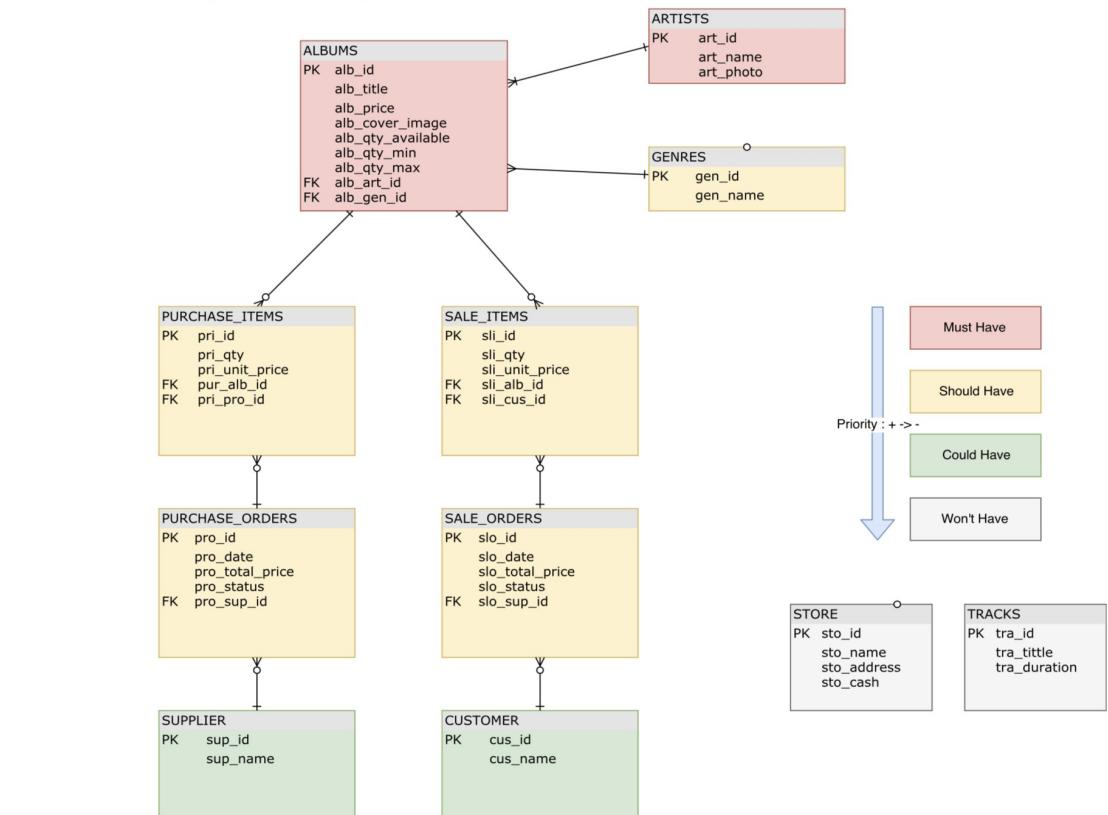

From the priorities and by following the dependencies between features, I drew this Gantt diagram to order the tasks :

#### Music Store Project : Gantt diagram

The ER diagram describes the schema of the database in order to persist data from the Music Store :

#### Music Store Project : ER diagram

This stage of development was just after adding the list of albums :

- [Genres](#)
- [Artists](#)
- [Albums](#)
- [Customers](#)
- [Suppliers](#)
- [Sale Orders](#)
- [Purchase Orders](#)

## Albums

Create a new Album		Title & Artist	Genre	Stock Purchases	Price/Unit	Sales	Modify	Delete
Cover				Avail. Qty Pur.	Qty. Sold			
	A Hard Day's Night The Beatles		Pop	9 18	14			
	A Quick One The Who		Pop	5 66	£16	Total 224	<a href="#">Modify</a>	<a href="#">Delete</a>
	Abraxas Santana		Rock	Max. Nb. Sup.	Nb. Cus.

# 6 Week N°11

## 6.1 P.18

The test code is the “getProposition” method which is expected to return a proposition as a String depending on the type of question answered :

```
21     public String getProposition(){
22
23         switch(enumQuestionType){
24             case DEFINITION_WORD:
25                 this.label = this.meaningModel.getWordModel().getWordEntity().getSpelling();
26
27             case WORD_EXAMPLE:
28                 this.label = this.meaningModel.getMeaningEntity().getExample();
29
30             case EXAMPLE_WORD:
31                 this.label = this.meaningModel.getWordModel().getWordEntity().getSpelling();
32
33             case WORD_DEFINITION:
34                 this.label = this.meaningModel.getMeaningEntity().getMeaning();
35
36             default:
37                 this.label = this.meaningModel.getWordModel().getWordEntity().getSpelling();
38
39         }
40
41         return this.label;
42     }
```

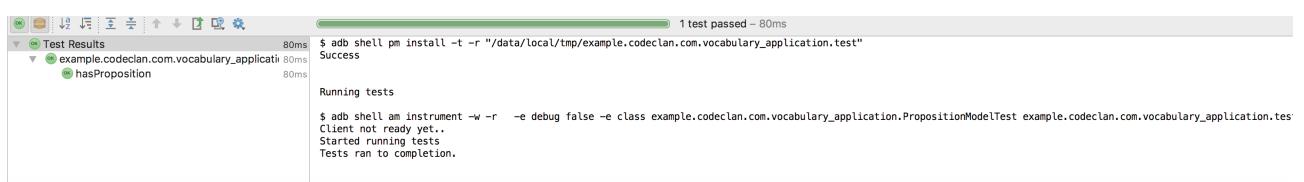

The test fails because the expected proposition does not match with the current proposition returned by the method “getProposition”

The “getProposition” method is fixed by adding the break statements which were missing for each “case” :

```
21     public String getProposition(){
22
23         switch(enumQuestionType){
24             case DEFINITION_WORD:
25                 this.label = this.meaningModel.getWordModel().getWordEntity().getSpelling();
26                 break;
27
28             case WORD_EXAMPLE:
29                 this.label = this.meaningModel.getMeaningEntity().getExample();
30                 break;
31
32             case EXAMPLE_WORD:
33                 this.label = this.meaningModel.getWordModel().getWordEntity().getSpelling();
34                 break;
35
36             case WORD_DEFINITION:
37                 this.label = this.meaningModel.getMeaningEntity().getMeaning();
38                 break;
39
40             default:
41                 this.label = this.meaningModel.getWordModel().getWordEntity().getSpelling();
42                 break;
43
44         }
45
46         return this.label;
47     }
```

The test is passing after the correction :

# 7 Week 12

## 7.1 P16

The program uses a cryptocurrency API to collect some data like the current price, the intraday volume exchanged, the last 24h fluctuation.

```
CryptoCurrencyAPI.prototype.sendRequestgetAllCurrenciesByNameOrSymbol = function(nameOrSymbol, portfolioFilter){  
    let url      = this.url+"all/coinlist";  
    let request = new XMLHttpRequest();  
    request.open("GET", url);  
    request.addEventListener("load", this.sendRequestgetAllCurrenciesByNameOrSymbolResult.bind(request,  
                                              this, nameOrSymbol, portfolioFilter));  
    request.send();  
}  
  
CryptoCurrencyAPI.prototype.sendRequestgetAllCurrenciesByNameOrSymbolResult = function(self,  
                                         nameOrSymbol,  
                                         portfolioFilter){  
  
    if(this.status === 200)  
    {  
        let JSONcurrencyList = JSON.parse(this.responseText);  
        let currencyEntities = CurrencyEntityConverter.convertJsonToCurrencyListFiltered(JSONcurrencyList,  
                                         nameOrSymbol,  
                                         portfolioFilter);  
  
        self.sendRequestGetDataCurrencyBySymbol(currencyEntities, null);  
    }  
    else  
    {  
        console.log(this.error);  
    }  
}
```

All these data provided by the API are rendered through this user interface which belongs to a portfolio management application :

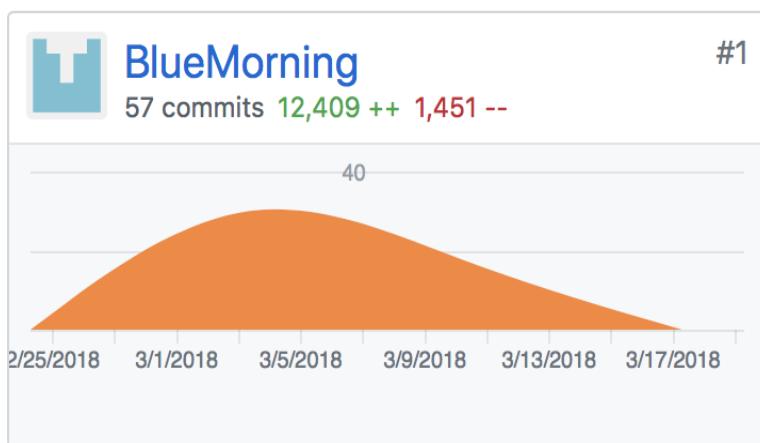

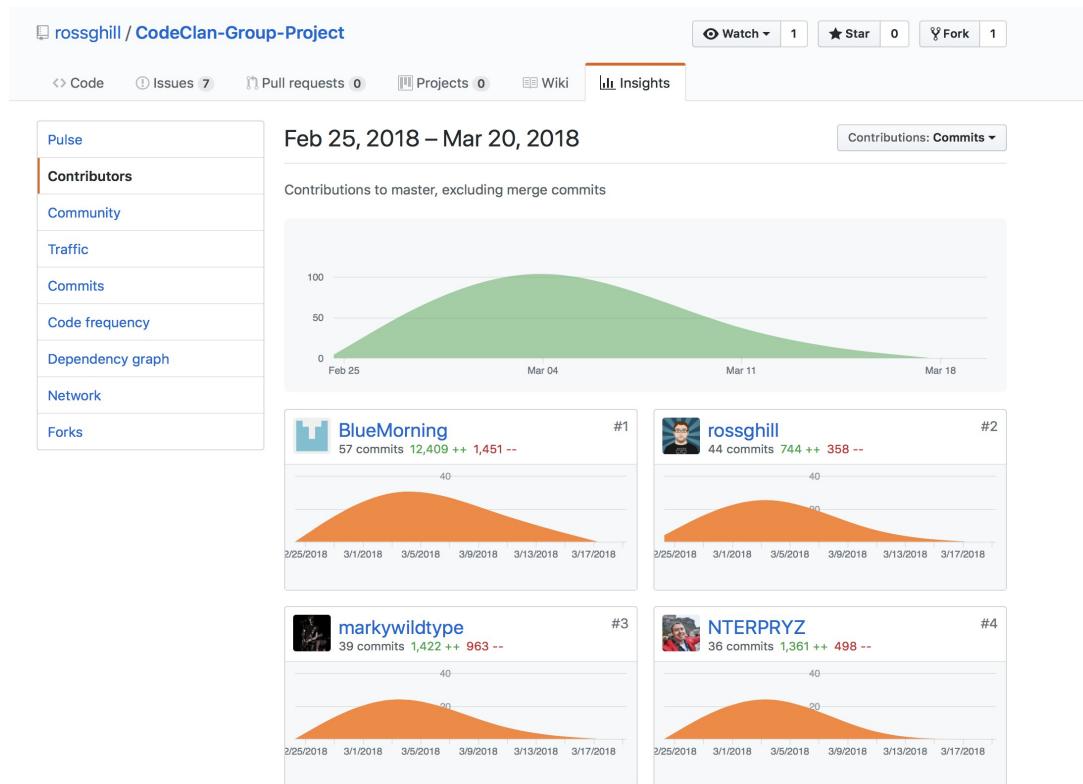

Portfolio Management									
Wallet Balance									
Cash	\$ -333687.97			0

# 8 Week 14

## 8.1 P1

My profile is "BlueMorning" :

<https://github.com/rossghill/CodeClan-Group-Project/graphs/contributors>

## 8.2 P2

This brief describes the expected MVP and extensions for our Travel Packages application :

### OBJECTIVE

---

### MVP

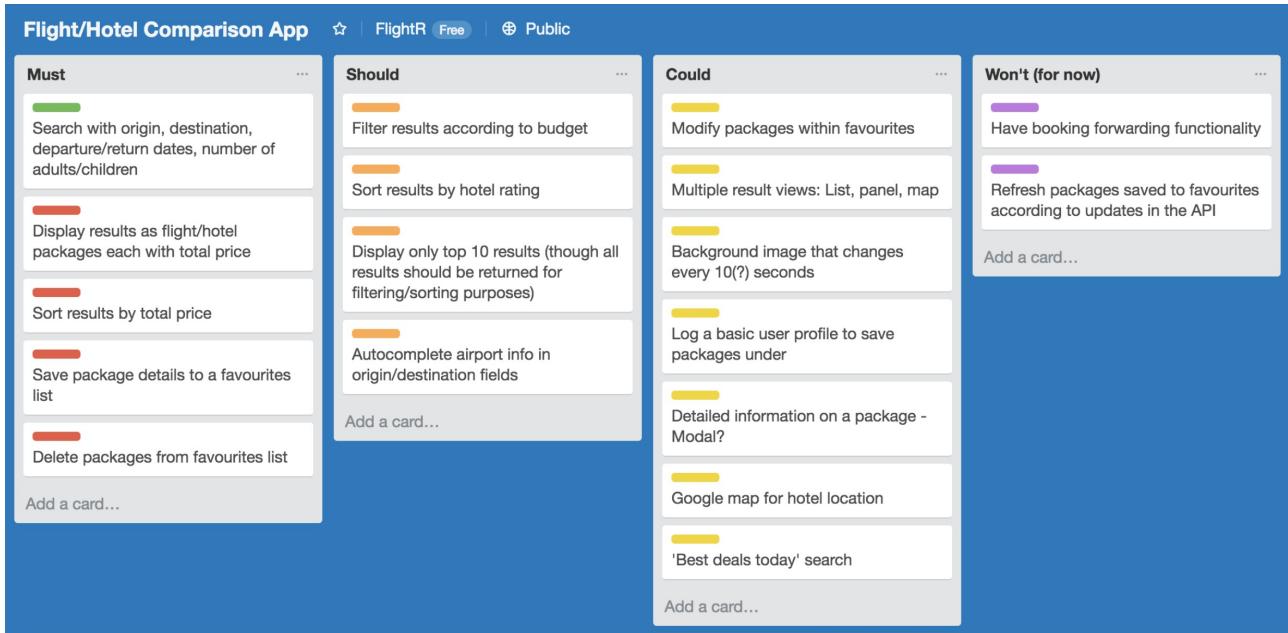

- User can search by departure and return dates
- User can view available flight and hotel options for their dates
- User can sort flight & hotel packages by price
- User can add packages to a favourites list

### EXTENSIONS

- Filter results by various criteria
- Show large map and mini map
- Modal UI for displaying favourite packages
- Add user profile account option

## 8.3 P3

This is the Trello MosCow board of our “Travel Packages” application :

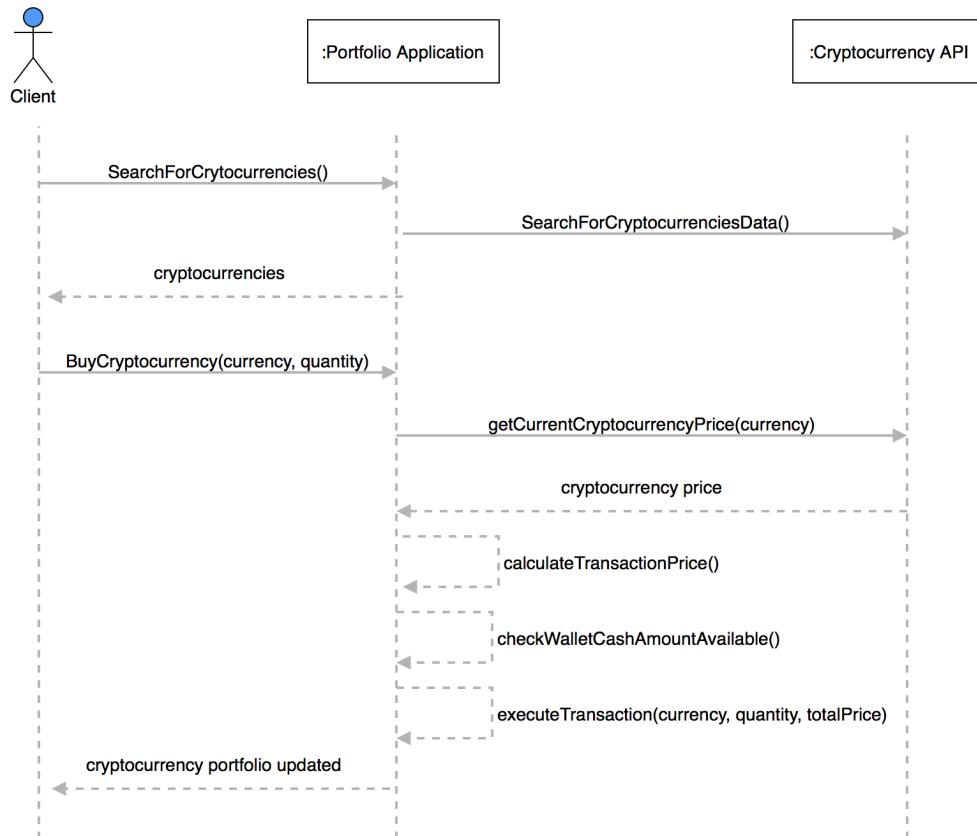

## 8.4 P4

Acceptance criteria	Expected Result/Output	Pass/Fail
A user is able to search for travel packages.	A list of travel packages is displayed to the user.	Passed.
A user can refine his searching criteria by package prices.	The list of travel packages is updated to match with the filter on price.	Failed.
A user can add a travel package to his favourite.	The travel package is added to the list of favourite of the user.	Passed.
A user can remove a travel package from his favourite	The travel package is removed from the list of favourite of the user.	Passed.
A user can select the display mode "map"	The list of travel packages is displayed on a GoogleMap.	Passed.
A user can browser his list of favourite travel packages.	The list of travel packages is displayed within a modal window.	Failed.
A user can set the number of adults and children who are going to travel.	The search bar for travel package displayed those filters and the search matches with them.	Passed.

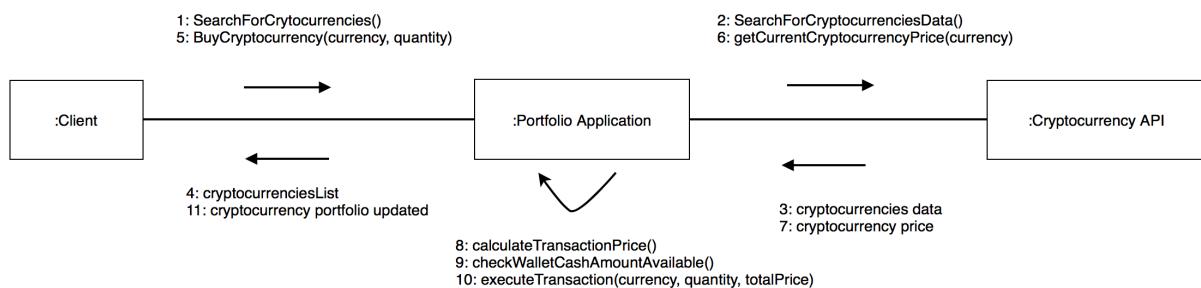

## 8.5 P7

### 8.5.1 Sequence diagram

This sequence diagram describes the process of buying cryptocurrencies through the portfolio application.

### 8.5.2 Collaboration diagram

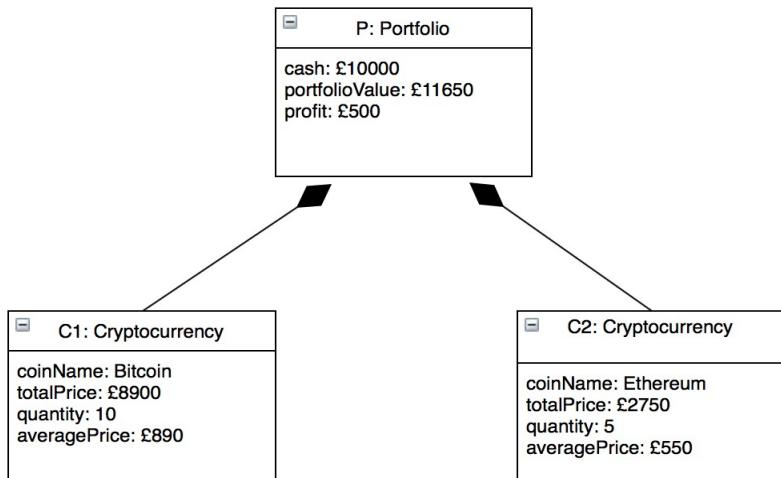

The collaboration diagram describes the objects committed in the process of buying cryptocurrency through the portfolio application.

## 8.6 P8

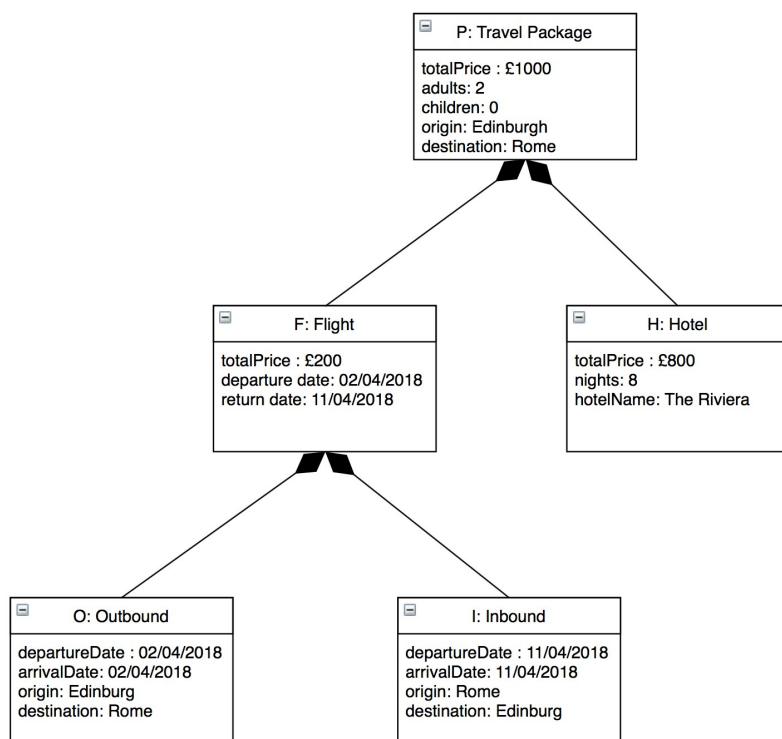

### 8.6.1 Object diagram N°1

This object diagram is a representation of a portfolio which contains 2 cryptocurrencies.

### 8.6.2 Object diagram N°2

This object diagram represents a travel package made of a flight return and a hotel booking.

## 8.7 P9

### 8.7.1 Algorithm N°1

```
sendRequestGetCurrencyDataList(currencyEntities){

    this.currencyAPIRequest.onRequestGetCurrencyDataList = this.requestGetCurrencyDataListDone.bind(this);

    let coinSymbols = "";
    currencyEntities.forEach((currency) => {
        if((coinSymbols + currency.coinSymbol).length < 300)
        {
            coinSymbols += currency.coinSymbol+",";
        }
    })

    if(coinSymbols != null && coinSymbols != ""){
        coinSymbols = coinSymbols.substring(0, coinSymbols.length-1);
    }

    this.currencyAPIRequest.requestCurrencyDataList(coinSymbols);
}
```

This algorithm aims at building the API query and call IT to get the current currency values. As this API only accepts a list of coin symbols as a String whose length is smaller than 300 characters then I need to check if the String length is short enough to add a new coin symbol. Then the call to the API can be made without taking the risk to exceed its limit of 300 characters.

### 8.7.2 Algorithm N°2

```
searchForCurrencyDataList(coinNameFilter, isLockOnPortfolio){

    this.coinNameFilter = coinNameFilter;
    this.isLockOnPortfolio = isLockOnPortfolio;

    this.databasePortfolioModel.checkCurrencyReferencesExist((isReferences) => {
        if(! isReferences){
            this.currencyAPIRequest.onRequestGetAllCurrenciesDone = this.request GetAllCurrenciesDone.bind(this);
            this.currencyAPIRequest.requestAllCurrencies();
        }
        else{
            this.databasePortfolioModel.getCurrenciesReferencesByCoinName(this.coinNameFilter,
                this.isLockOnPortfolio,
                this.resultLimit, (currencyList) => {
                    this.currenciesList = currencyList;
                    this.sendRequestGetCurrencyDataList(this.currenciesList);
                })
        }
    })
}
```

This algorithm aims at returning all the coins whose names match with the name filter passed as a parameter. If the coin list does not exist yet in the database then a method is called before executing the search in order to populate the database with the reference of all the coins. Then, the search is always performed on a list of references which exists in the database.

## 8.8 P17

<b>Intent</b>	<b>Result</b>	<b>Action undertaken</b>	<b>Result again</b>
Perform a search on coin names with "Bitcoin".	Failed. No results found.	Make the search case insensitive to be independent of lowercase and uppercase.	Passed. The coins whose names start with "Bitcoin" are found.
Buy a quantity "n" of coins which does not exist in the portfolio.	Passed. The quantity "n" has been added to the portfolio.		
Sale a quantity "n" of coins.	Failed. The quantity "n" has been removed from the portfolio but the amount of cash available in the wallet has not been increased.	Couple the actions : sell and wire the money from the sale to the wallet cash amount.	Passed.
Buy a quantity "n" of coins which already exists in the portfolio.	Failed. The quantity already present in the portfolio should be increased by "n" while a new line has been created in the portfolio.	Check whether the coin line already exists in the portfolio : If it does then update the quantity otherwise insert a new line in the portfolio.	Passed.
Activate the mode "LiveData"	Passed. The current values of coins are refreshed automatically.		
Activate the mode "Lock on portfolio"	Failed. The coins displayed should only be those from the user's portfolio.	Add a boolean as a new parameter on the query which gets back the coins to check whether those coins are present in the user's portfolio.	Passed. When the mode "Lock on portfolio" is activated then the coins displayed are those from the user's portfolio only.

## 8.9 I&T
